

# WEBWATCHBOT 3.0

## Monitoring, Alerting and Analysis Software for Web Sites and IP Devices

By ExclamationSoft

### n Monitor to Maximize Availability and Reliability

WebWatchBot proactively monitors websites and IP devices 24/7 with 8 different highly configurable watch types. Use WebWatchBot to manage service level agreements.

### n Alerting Provides First Line of Defense

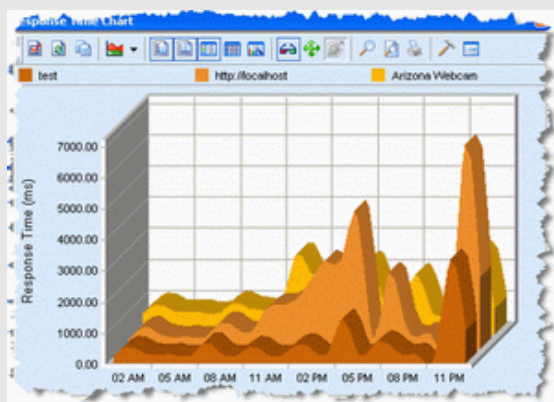

WebWatchBot provides real-time alerting, including e-mail, cell phone, SMS, on-screen pop ups, and .wav files. Customizable reports can be sent with an e-mail alert for immediate and detailed problem information.

### n Plan for Problems

WebWatchBot incorporates the ability to automatically execute a program or batch file if problem conditions are met, such as restarting a web server or rebooting a server when downtime is not an option.

### n Insightful Analysis Right Out of the Box

WebWatchBot features real-time charting, historical and trend analysis, and customizable reporting. Built in analysis tools give you the information you need to optimize systems and prevent future problems.

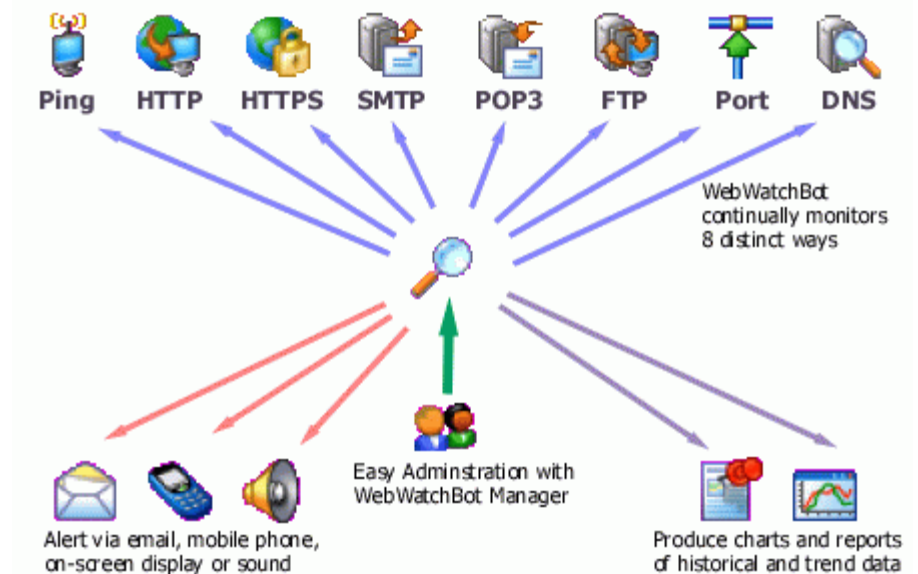

### n Download, Install, and Go Deployment

Deploying WebWatchBot is as easy as "download, install and go". Within minutes you can download WebWatchBot over the Internet, install on your Windows operating system, and immediately start using the product.

WebWatchBot gives you the power to excel in today's challenging 24/7, always open online business world. Customers demand maximum availability and reliability from your organization and your organization demands it from you. Keeping watch on all your systems, and knowing about problems before they impact your customers, is no small feat in today's do-more-with-less world. WebWatchBot is a sophisticated and dependable solution, priced to fit in your toolbox.

WebWatchBot is the leading solution for monitoring internal and external websites and IP devices. Our customers are typically System Administrators, Webmasters, and Website Programmers who need to ensure system availability and reliability, be notified of problem conditions, and analyze historical data and trends.

WebWatchBot is an agent-less solution that deploys in minutes. This means no intrusive installation of software on the devices being monitored. Administration is a snap, and it comes pre-configured with examples to help get you started right away. Should you need it, extensive documentation and support are just a click away.

WebWatchBot monitors the performance of servers, alerts users of problems, and reports data

#### **n Ease of Administration**

WebWatchBot users benefit from a rich user interface that makes administration easy and intuitive, yet powerful and highly-configurable. Real-Time views of watch items provide an immediate understanding of website or device health.

#### **n Agent-Less Monitoring**

WebWatchBot is an agent-less monitoring system which monitors websites and IP devices remotely, without the need to install software on the systems being monitored.

#### **n System Requirements**

WebWatchBot runs on Windows NT 4.0 / 2000 / XP / 2003 . Processor requirements are a 300 MHz Pentium, equivalent or higher. Recommended RAM is 128MB.

#### **n Available Watch Types**

- Ping
- HTTP
- HTTPS
- SMTP
- POP3
- FTP
- Port
- DNS

#### **n Available Alert Types**

- Email to any email enabled device including cell phone, SMS (via gateway), or pager.
- Visual via on-screen pop-up window.
- Audible sound by playing .wav file
- Execute any program or load a URL

#### How WebWatchBot Works

WebWatchBot is a low overhead solution that can be installed on a single server to monitor hundreds of websites or IP devices. WebWatchBot monitors through the configuration of "watch items". A watch item can be a URL to an HTTP server, or the IP address of a device. You determine the frequency that a watch item is checked (once a second to once a day), set and report on performance thresholds, and configure other settings to ensure monitoring of critical systems.

Real-time charts provide a moving snapshot of a watch item's health, but WebWatchBot doesn't wait for you to check in. In the event of an error or deteriorating performance, WebWatchBot will notify you by sending an email alert via email, cell phone, pager or SMS (via gateway). You can also select alert notification by pop-up visual alert window and playing of audible .wav file. Furthermore, WebWatchBot can execute any program or batch file that in turn can restart your web server or even reboot the server.

With data collected, WebWatchBot you can create custom reports in HTML, CSV, or XML form, and custom charts for historical or trend analysis.
